Les communautés bactériennes de sols uranifères naturels : impact de l'uranium sur la diversité

A toxic element widespread in the environment

Anthropogenic uranium is widely disseminated in the environment (nuclear industry, mining activities, use of phosphate fertilizers).

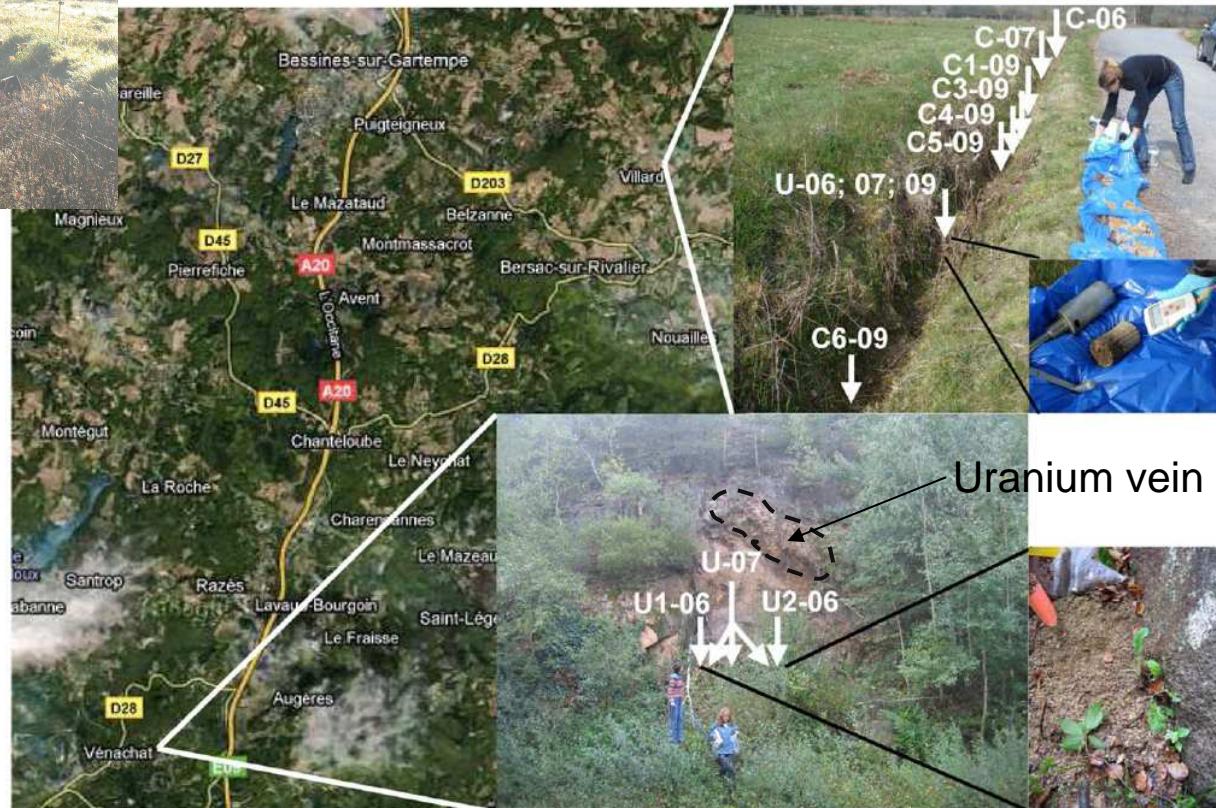

Occurs naturally in some minerals (uranium ores)

Bacterial diversity in natural uranium ores ?
Impact of uranium on soil bacterial communities in
natural conditions ?
Toxic effect ?

Sampling sites : Bessines (Limousin)

Vénachat

✓ contrasted uranium concentrations
between U and C samples

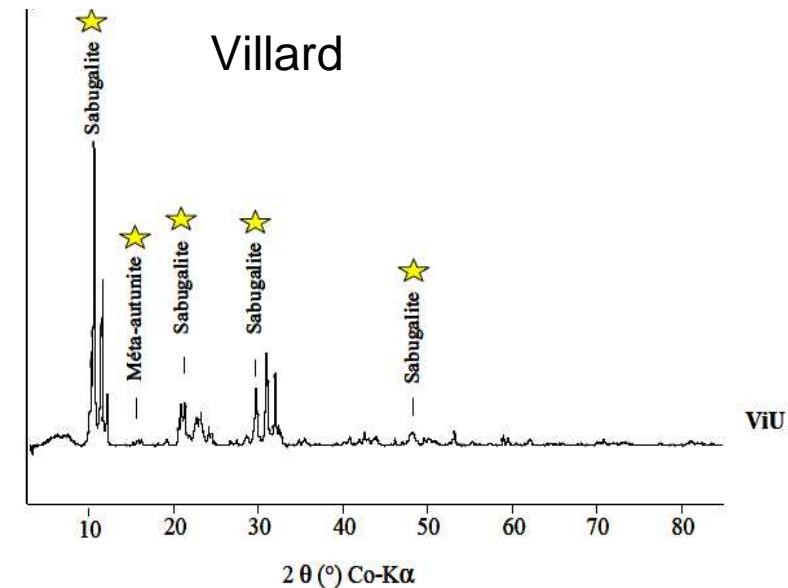

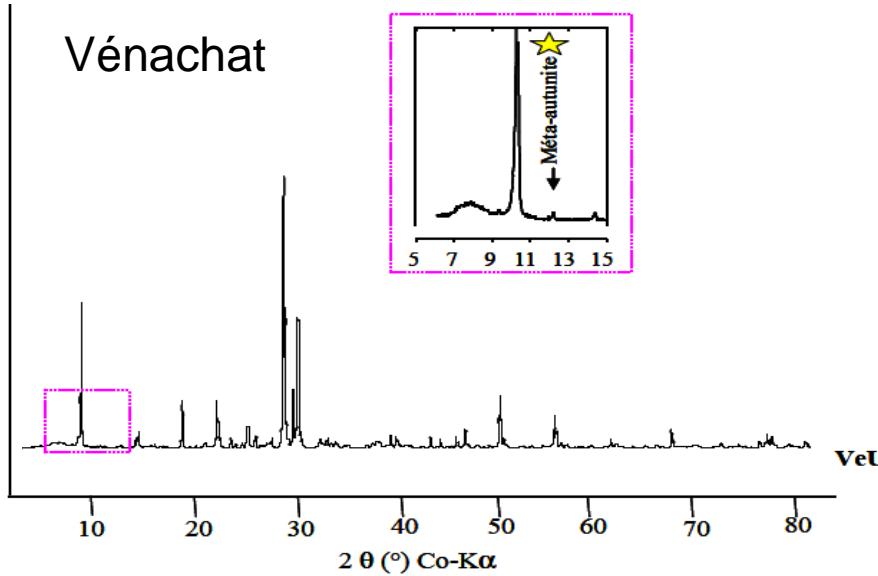

Villard

Uranium speciation in soils

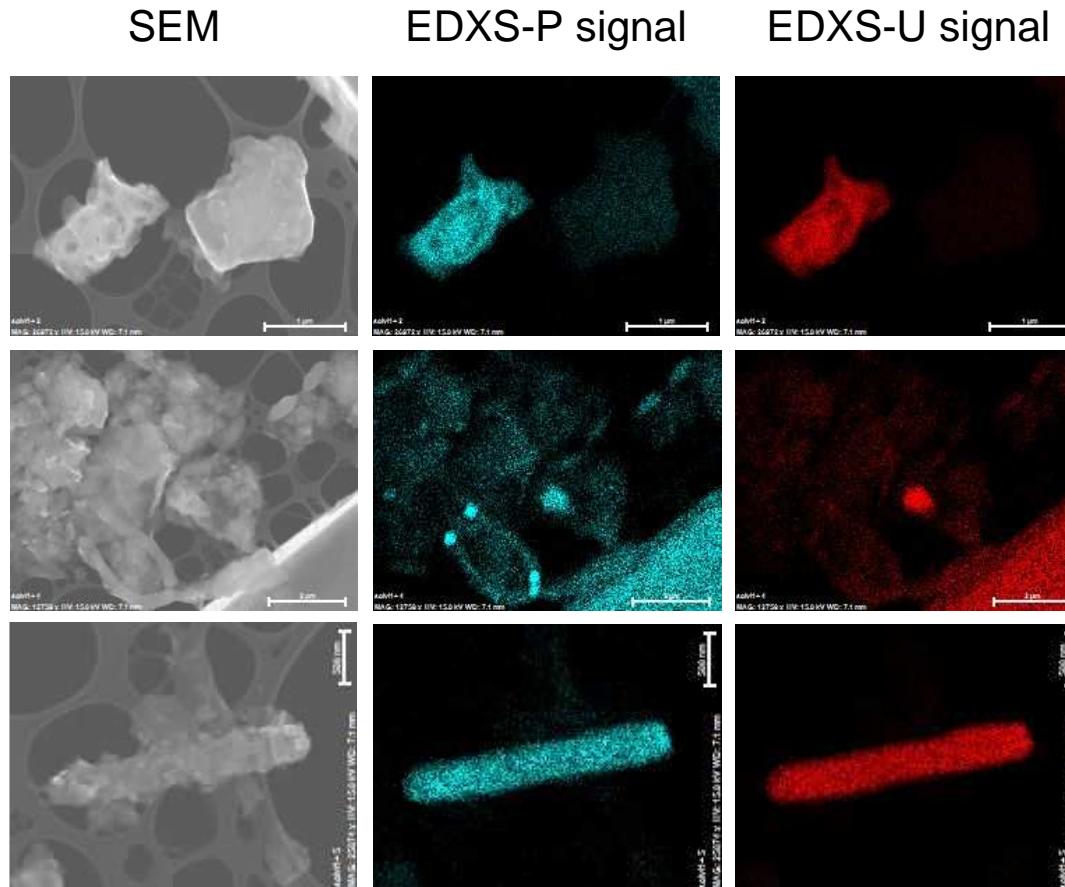

- ✓ XANES region: U(VI)
- ✓ EXAFS: U-phosphate and non-identified species

Mineralogical analysis : XRD

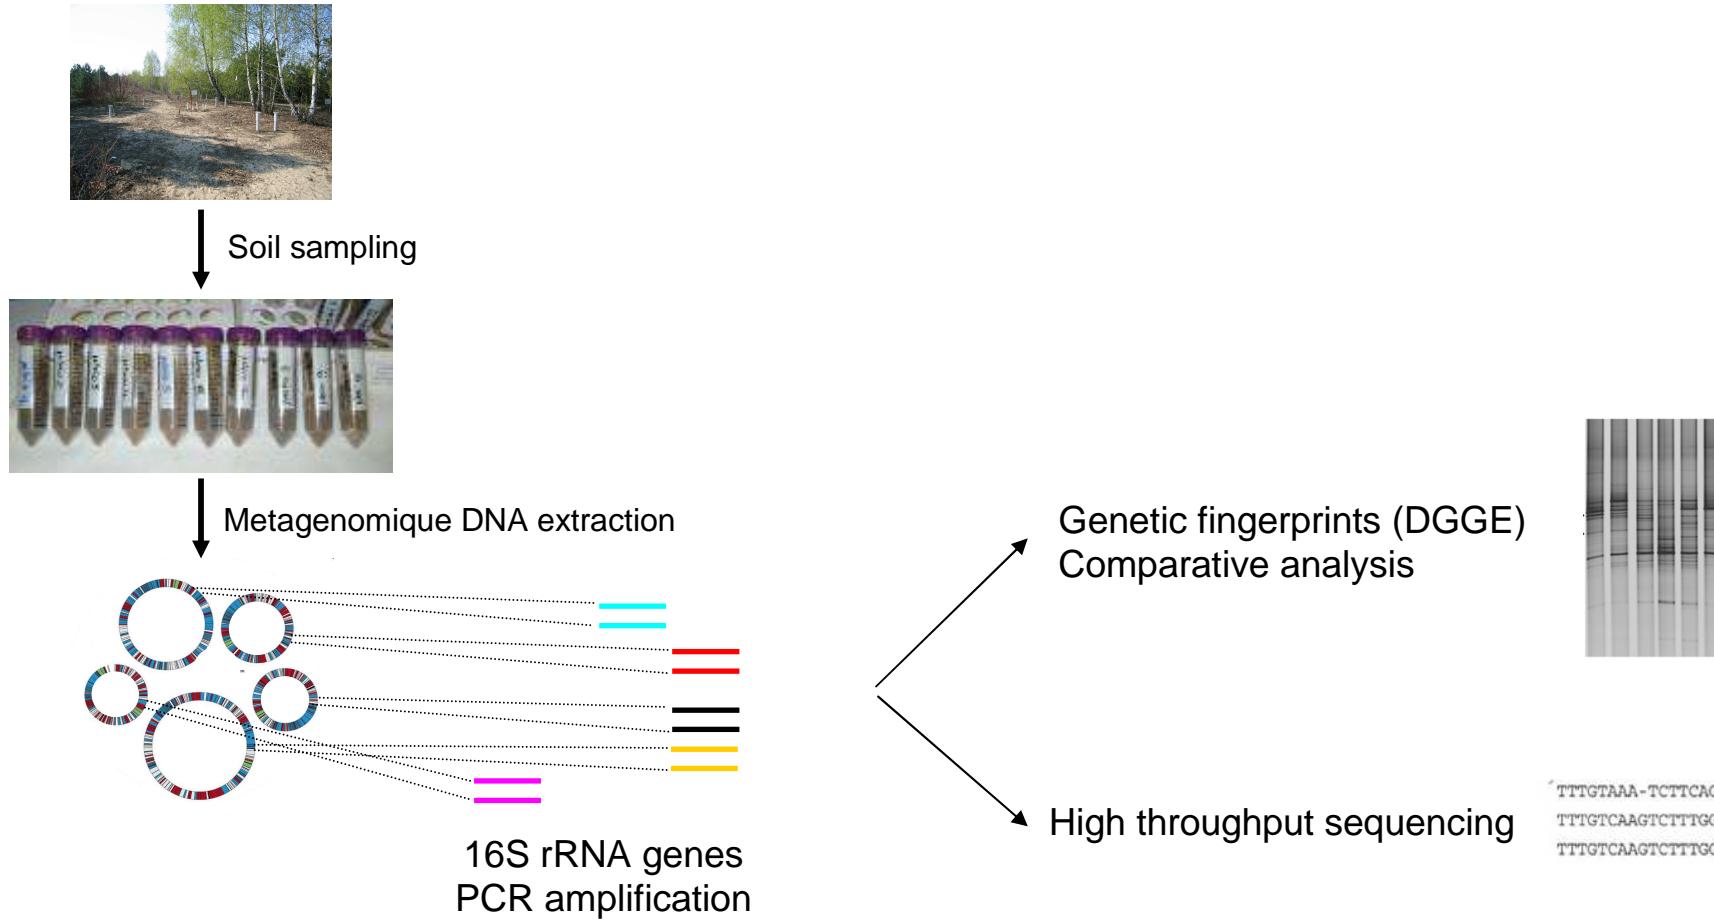

- ✓ meta-autunite and sabugalite belong to the mineral family of uranium-phosphate
- ✓ bioavailability of uranium in soils ?

Microscopic observations of Villard soil particles

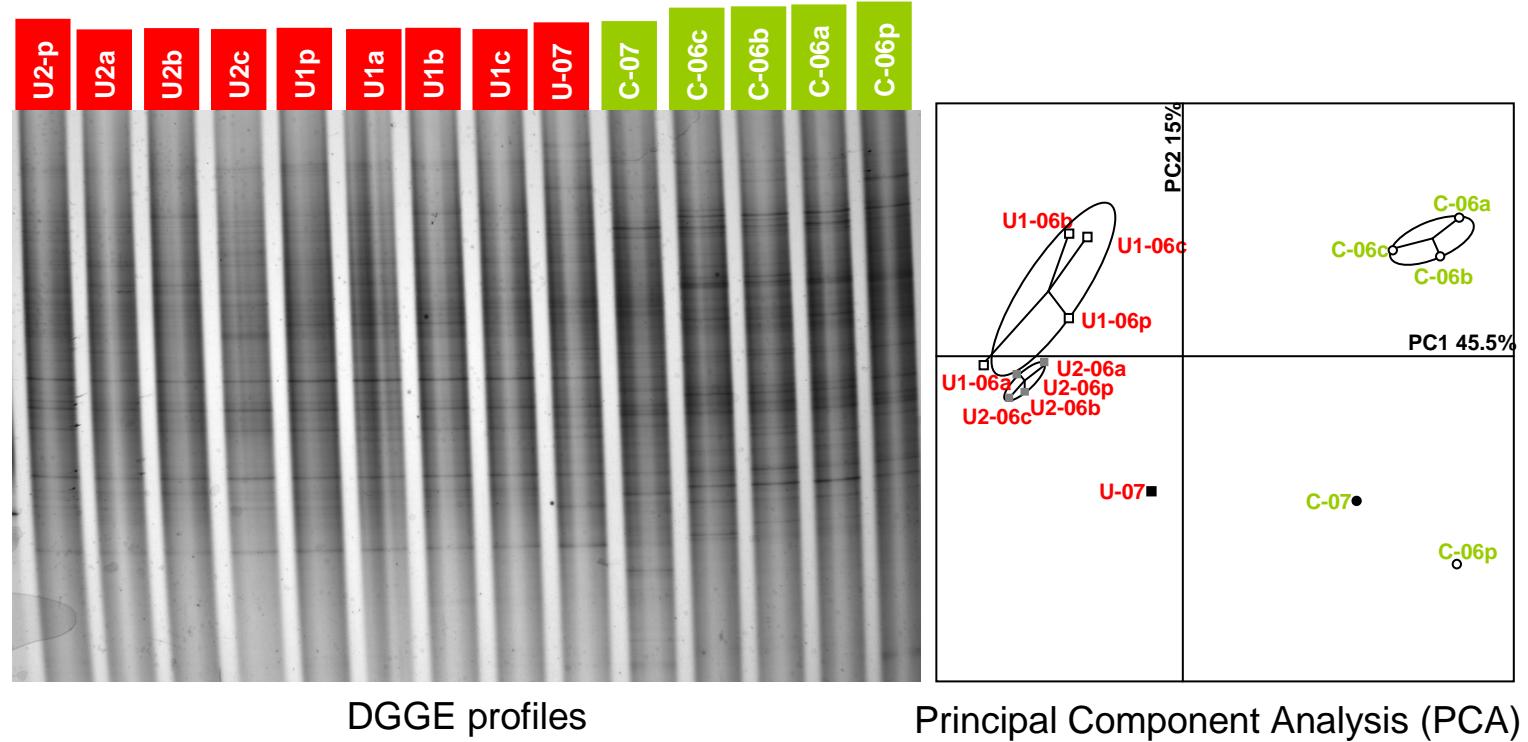

✓ bacteria are exposed to uranium *in situ*

Molecular approaches to study bacterial communities

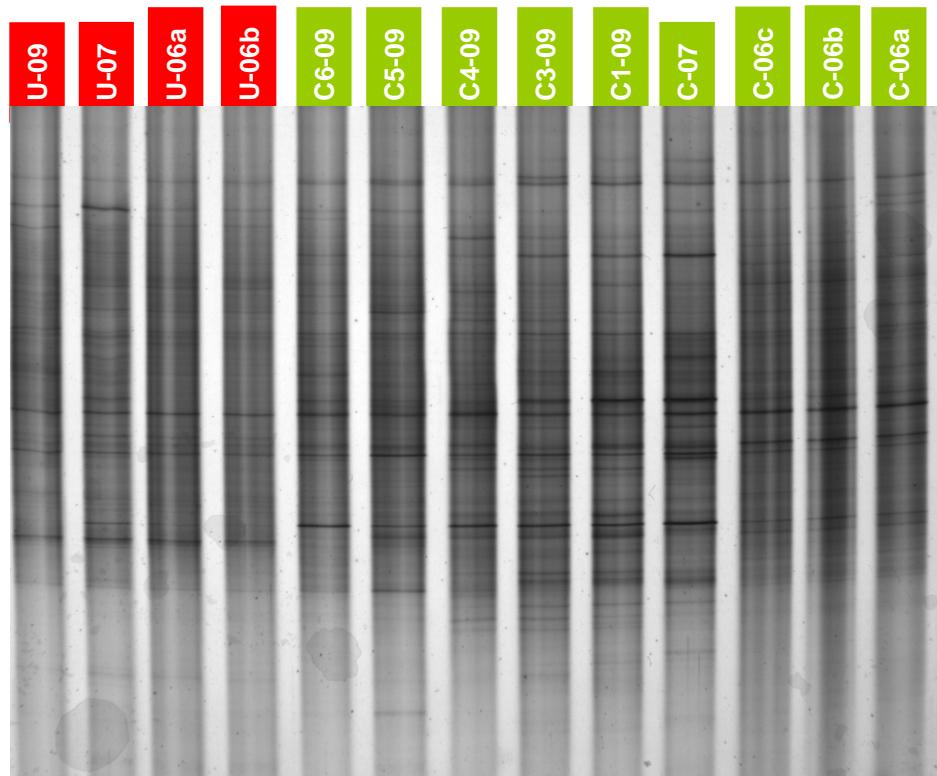

Bacterial community analysis (Vénachat)

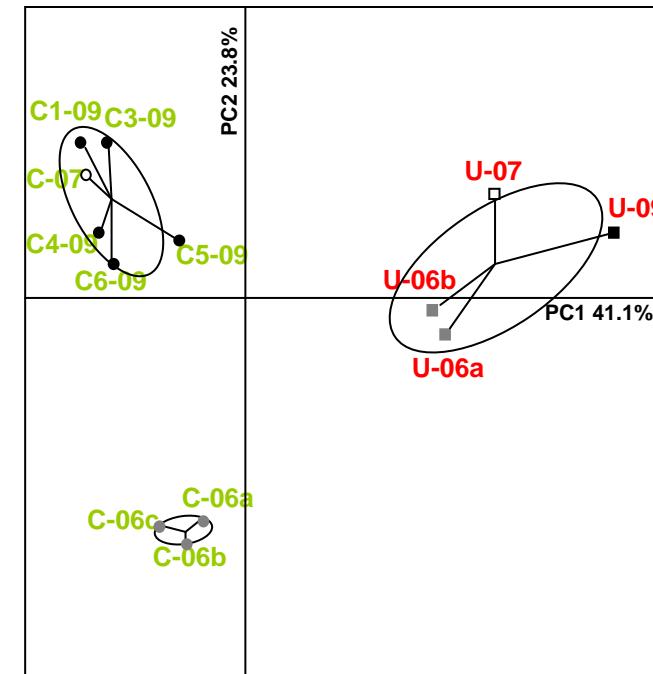

- ✓ high diversity in all samples
- ✓ U and C profiles clearly separated on the PCA

Bacterial community analysis (Villard)

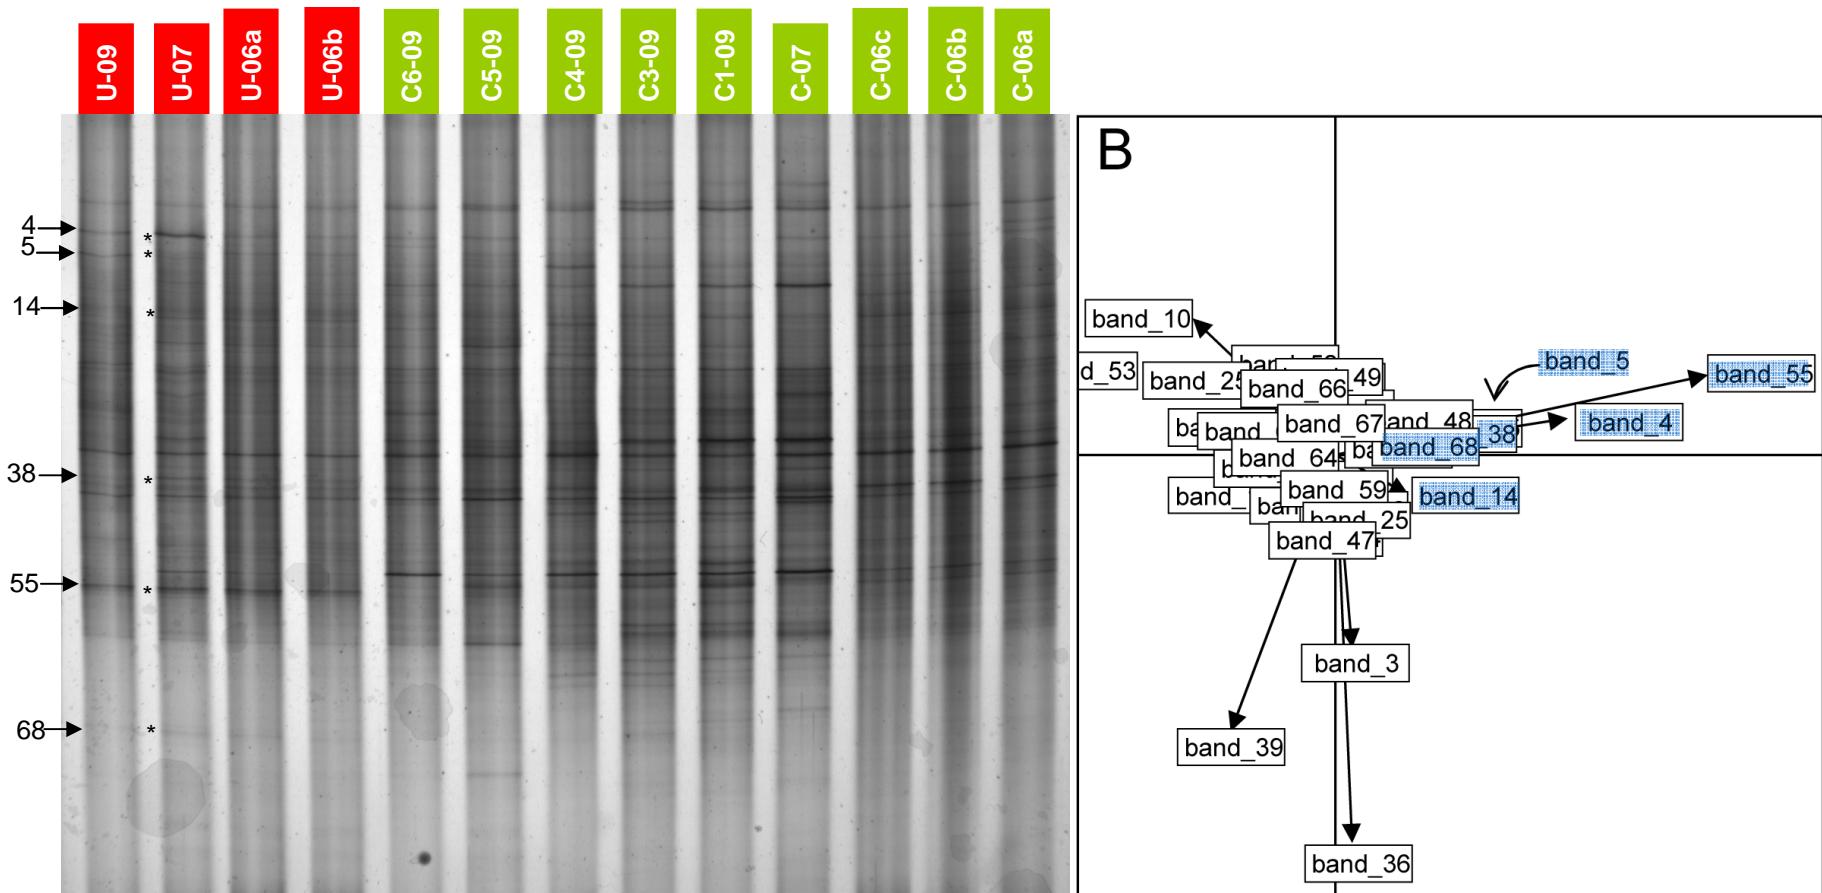

DGGE profiles

Principal Component Analysis (PCA)

- ✓ U-specific bacterial community
- ✓ Highly stable

Identification of uranium-specific bacteria

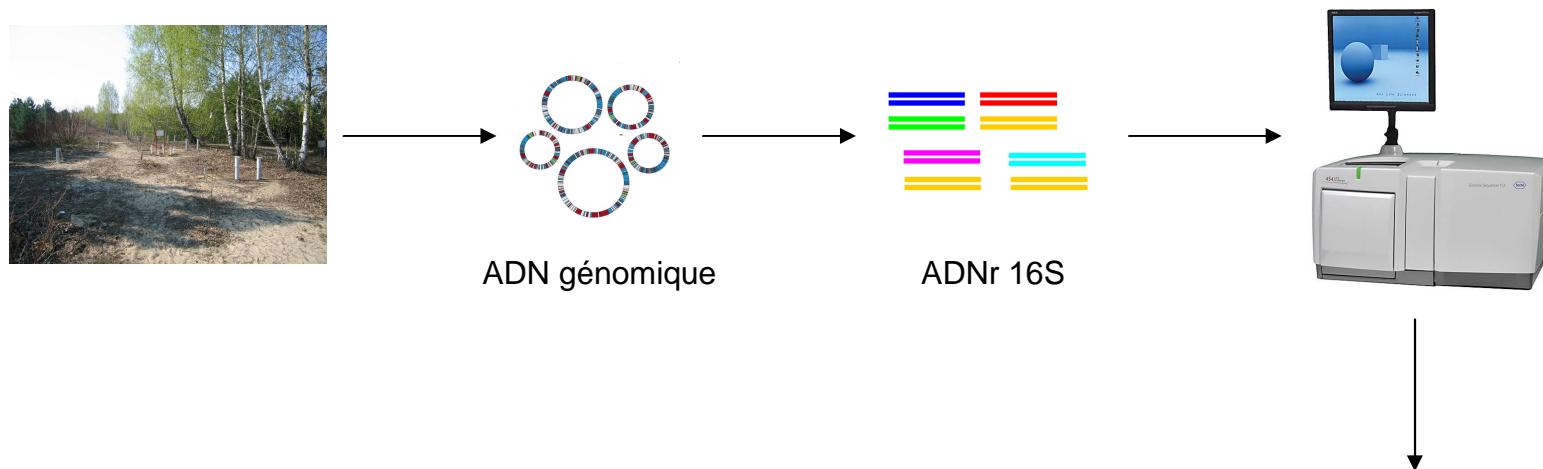

Identification of some uranium-specific bacteria

✓ a redox cycle of uranium in the soil ?

High throughput pyrosequencing (454)

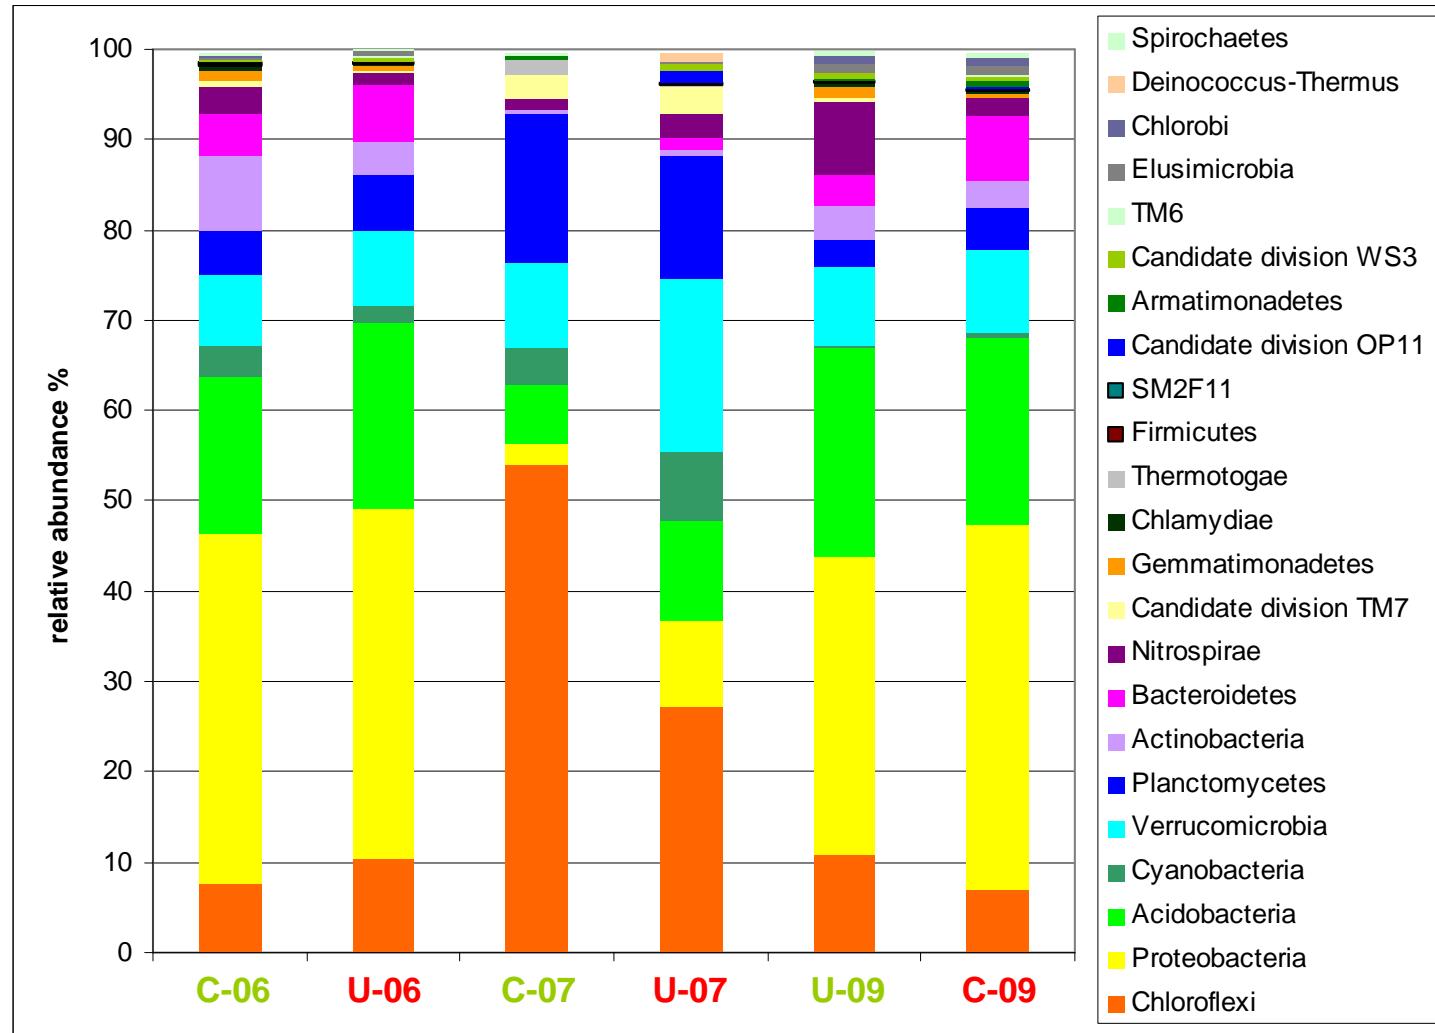

An average of 16,000 sequences per sample

An in-depth analysis of bacterial communities

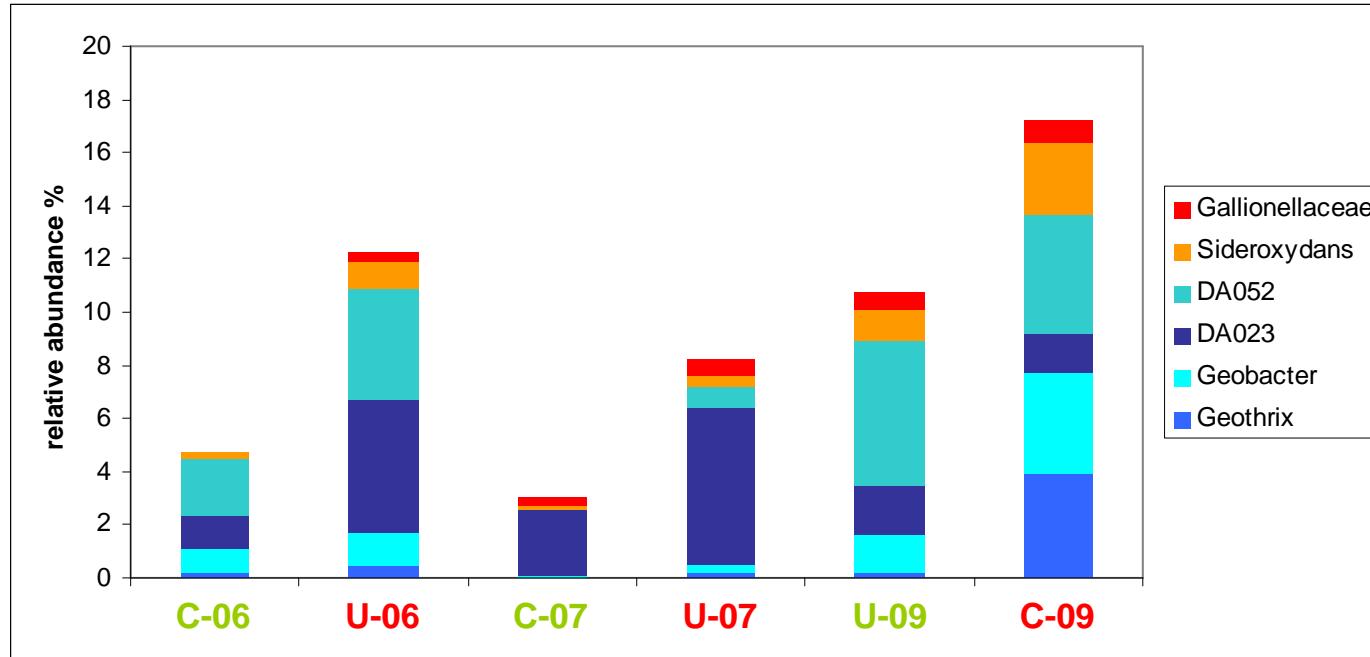

✓the diversity is saturated

Relative abundance of the 23 phyla detected in the soils

✓ no obvious differences between radioactive and control samples.

Focus on iron-reducing and -oxidizing bacteria

- ✓ Enrichment in iron-reducing and oxidizing species in the presence of high uranium content

Iron-reducing bacteria are active in the soil samples

iron(III) culture media
10 days incubation

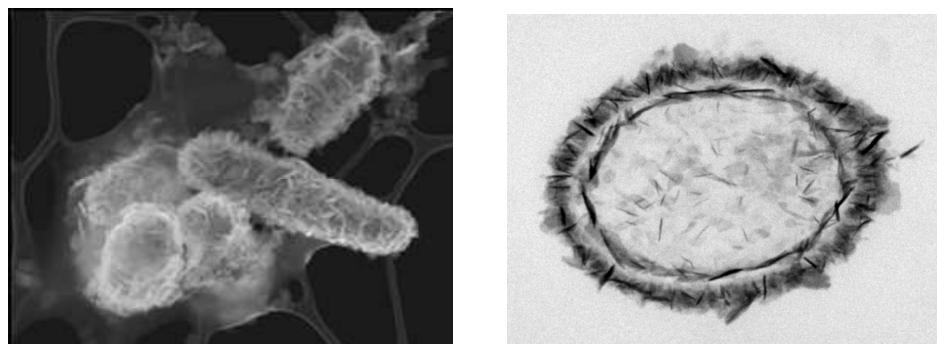

iron(III) culture media
+
uraniferous soil
10 days incubation

Conclusions

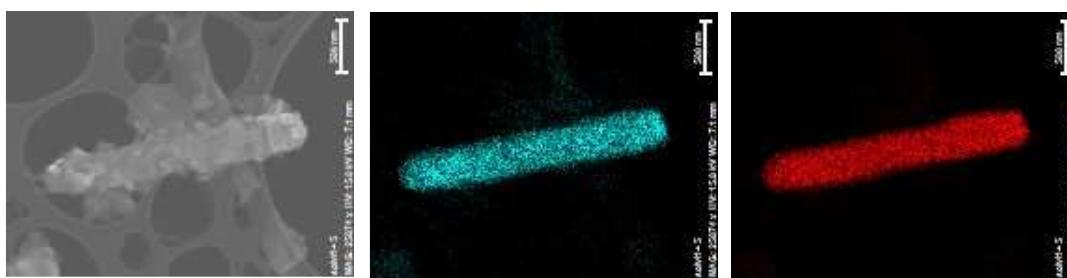

- bacterial diversity is not significantly reduced in meta-autunite and sabugalite rich soils,
- enrichment in iron-reducing and iron-oxidizing species is detected in the presence of uranium ,
- these species represent a significant fraction of the total population in uranium rich samples and are active in the soil samples.

Ongoing studies...

A collection of uranium-resistant isolates:
Microbacterium, Arthrobacter,
Stenotrophomonas, Bacillus...

Biochemical analyses
Comparative genomics
